NONWHOLE IS EXISTENCE

To thinkers, discoverers and scientists unburdened by paradigms

Foreford

Welcome reader on the threshold of the unknown

Everything that will be discovered by means of thoughts in these books will become the work of a single man not a collective. Every interpretation of nonwhole, action initiated and the thought structures here is thus the discoverer's property; intuition is purely individual.

I follow the treatise „On the concept of Cosmona existence which is hope for mankind“. In its third section I define five concepts that, I think, belong to the foundations of human thinking. Thus it is not about criticism, correction, or further exploration of human intellect, but it is a supplement to the principles, in better terms, about ways or directions in human reasoning.

The first of five concepts reads: There exists something that is not whole but has components.

The second concept formulates the aim of the treatise „On the concept of Cosmona“ simply by the fact that the first concept was accompanied by the sentence: The Universe is one component of Cosmona .

The third concept is identical to the first with the only difference: the verb „to be“ is replaced by the verb „to make“, targeted at the discoverer's activity.

The fourth concept liberates creative activity from being grasped by the concept of whole while initiating various actions, descriptions of which will no longer be linked to rigid requirement of repeatability resulting in templates evidences, with their initial status of matter, environment, instrumentation or action.

The fifth concept relates to structures that are the domain of guiding thinking from the very beginning of mankind.

The existence of our solar system is estimated to be between four and fifteen billion years. The sustainability of human life on the Earth and consequently for fauna and flora is one or two orders lower. I have dealt with Cosmona for the hope of the permanent existence of mankind, if mankind wishes so. I know that permanent existence of mankind is not among urgent needs of contemporaries. However, it will become more relevant the more resources of the livelihood of mankind and the faster the living space of people, fauna and flora will diminish, and the more frequent

the cycles of Earth climate change in their glaciation or warming, or the movements of the Earth's crust, the inclination of the Earth will occur, not to mention the impacts of large meteorites.

Essentially, the successful realisation of survival of mankind implies the harmonious coexistence of human communities, where solution problems will not depend on ideological, theological, ethnic, racial, economic and educational differences. From today's perspective it is about the almost utopian population of the next tens of millennia. Nobody it may seem to some that the question of the survival of mankind outside our solar system is the music of the distant future, but let us not be mistaken. Today we can fly to Egypt to see the sights four thousand years old.

I realized that in favour of Cosmona I was constantly suppressing the other four concepts from „the Supplement to basic elements of human thinking“ on which I base myself, for their, as I hope, practical use. Despite this suppression, I used to see today's and future discoverers unburdened by paradigmatic thinking and, of course, the thoughtful people of various crafts of human skills possessing thoughtful souls and intelligent expression in their eyes. To them, whom I embrace, I wrote this reflection or treatise, for whom I chose an action summary name – Nonwhole is existence.

THE FIRST BOOK

Thoughts taken of some verbal works of arts.

Whole, existence, world

It is usually a good custom to quote several thinkers' thoughts in this case they cover the umbrella term of nonwhole. It is obvious that nobody expresses the new concept of nonwhole precisely. There are, therefore, three concepts – whole, existence, world, which are intrinsically related, as I bring in the second book. This is just a sample of those who have ever commented on the topic - whole, existence or the world, in which they lived and worked. The samples have an illustrative character in relation to the content of the following books. Translation of quotes from classics emphasize the meaning and content. You can use public sources like Wikipedia and the like to compare.

WHOLE

Animals, fauna in general and, of course, people having boasted the name "homo" since their earliest times have no difficulty in realizing the existence of the whole. Therefore, I consider the concept of the whole to be slightly trivial.

„Something else would be itself that surrounds and something else would be gathered around; since the same thing will not be passive and active simultaneously; thus the thing would not be the same thing, but two things.“¹/Plato, Parmenides, II, 138b

„Thus per se (hen) which exists is probably per se even manifoldness (polla), even whole, even parts, even limitess, even endless in quantity.“²/Plato, ibid, 145

„...it then, apart from what is nothing, is complete and solid, since we define the whole (to holon) in this way, namely, it is something that misses nothing, such as the whole man or whole chest; and as is in case with the detail, even in the highest sense, and thus the whole is this, where there is nothing outside; what lacks something is outside, is incomplete, no matter what.“³/Aristotle, Physics, 207a5

„Immediate the ratio is ratio of whole and components; the content is the whole and consists of opposite parts (forms). Parts differ from one another and are separated from one another. However, they are parts in their identical relationship with one another, in other words, if they form the whole together. However, the summary is the opposite and negation of the part. The ratio of the whole and the parts is false if its concept and reality do not match each other. The concept of the whole lies in its ability to contain parts.“4/Hegel, Little logic, §125

What do statements on whole depend on? They depend on completeness, closedness, composition, final arrangement and do not define the size of something that is the subject of the description.

EXISTENCE

We do not lack the notion of existence in everyday life. No one will say – „I have seen „existence“ of a house or I heard hundreds of „existences“ of fans shout a goal“. Existence must exist and, and if it is expressible, it becomes a concept, a word. Since the beginning of philosophy, the concept of existence has been a constantly refined concept responding to changing conditions of life and to increasing levels of knowledge.

„There is no origin for nonwhole and existence does not disappear. However, those who look at the true reality see the border of both“
5/BhagavadGita, the second session 2.16

„Thus existence is shared among all existences as there are many and none of the existences lack it, neither the smallest nor the largest? No way.“
Plato, Parmenidés, II, 114b

„The main thought of the judgement which I have created is that there is real existence and space and nascency, there had been three different sorts before the world was created.“7/ Plato, Timaios IV, 52d

„A certain kind of existence we call substance, in which we distinguish the matter, which in itself is not yet certain this there, and the form and the shape according to which something is already known as certain this there,

and the thirdly the whole which is composed of both. A matter is a possibility, shape is a reality, in a dual sense, for example, knowledge, as well as exploration or contemplation. It seems that substances are mainly bodies, namely natural, because these are beginnings of others.“8/Aristotle, De Anima, 412b

„Per se (one) and existence are identical and of one character, for they accompany each other like the beginning and the cause, although both do not explain the other concept; however, it does not matter if we understand them equally, and it is even beneficial. For it is the same if we say „one person“ or „a person existing“. And so how many species of per se there are, so many species of existence there are.“9/ Aristotle, Metaphysic 1003b20,35

„...It is important to think about things that are not obvious. Above all, nothing arises from nonexistence. For then everything would arise from everything, and there would be no need for seeds. And if what ceases to manifest itself disappeared in the nonexistence, all things would have passed away, because it would not exist, unless they decomposed. And the universe would be as it is now and will always be like this; there is nothing that could penetrate it and cause a change.“10/Epicurus, Epicurus greets Herodot, Leaves, In Diogenes Laertios: The lives, opinions and statements of the renowned philosophers

"But when we cognize that nothing can be created from anything, then the expression" Nothing can be generated from nothing ", is not considered to be an existing thing, nor as modus of thing, but an eternal truth that has its seat in the mind and is called the general knowledge or axiom.

“11/Descartes, Principles of philosophy, First part XLIX

„ Existence is being with its certainty, which is imminent or existing by its certainty, quality. Existence, reflected in itself in this certainty, is something existing here, it is something. Something is what it is, thanks to its quality and when it loses, it ceases to be, what it is. Quality as an existing certainty is opposite to the negation contained in it, but it is distinguished from it by reality. If we examine existence further as an existing certainty, there is what we understand reality.“12/ Hegel, Little logic, §90,91

What are statements about existence? The statements are associated with the most important verb – “to be”, which is firstly related to man and then to the material environment of man. Existence does not disappear, it is a reality.

WORLD

Each of us have his or her own world; both intrinsically inward and in relation to the close or distant surroundings, the world of our own time, the world of human existence.

„Furthermore, there is an infinite number of worlds, both similar and dissimilar to ours. Since atoms, as it has just been proven, are infinite, and they are also at their greatest distance. Such atoms, from which the world could be created or which could create it, would not be consumed on either one, nor a limited number of worlds, nor all the worlds similar to this one, nor all of those different from this. Therefore, there is nothing to prevent the number of worlds from being infinite.

“13/ Epicuros greets Herodot..., page 398

„What is it, the monks, nascency of the world?

Depending on the eye and shapes, visual consciousness arises, the encounter of the three is a touch. With touch as one’s condition there is feeling, with feeling as one’s condition of grasping, with grasping as one’s condition of being, with being as one’s condition of birth, with birth as one’s condition arises aging and death, sorrow, lamentation, pain, grief, despair. That is, monks, the demise of the world.“

14/Buddha, Dependent Origination, The world, Episode V/44.3

„If I ask about the size of the world in space and time, I find that with all my conceptual features it is equally impossible to say that it is infinite, as it is finite. For neither one nor the other can be contained in the experience, because both the experience of infinite space or the eternal time, and the experience of limiting the world by empty space or the world preceding

empty time, is impossible. It follows that solving the problem of the world size will always necessarily be wrong, whether we try to address it positively or negatively, because the notion of an existing sensory world is in itself controversial. “ 15/ Kant, Prolegomena to each the coming metaphysic... §52c

"Two things keep the mind growing with new and growing admiration, the more and more perseveringly thinking engage there: the starry sky above me and the moral law within me. The first one starts from the place I occupy in the outer sensory world, and extends the context in which I stand to the vast distances of the worlds and the worlds above, systems, and systems above, in addition to the unlimited times of their periodic movement, its beginning and duration. The first glimpse of the myriad of worlds destroys almost my importance as an animal creature who has to return the matter from which he was born to the planet (the mere point in the universe) when he was endowed with life force for a short time. On the other hand, the second view indefinitely increases my value as intelligence through my personality..." 16/Kant, Criticism of the practice intellect, Second part, page 276

I think it was right to quit quotations from the ideas of some philosophers by mentioning human personality.

NONWHOLE IS EXISTENCE

THERE EXIST SOMETHING WHICH IS NOT WHOLE BUT HAS COMPONENTS

THERE EXIST SOMETHING THAT DOES NOT MAKE WHOLE BUT HAS COMPONENTS

„In the Supplement to basic elements of human thinking“ (Polách, On concept of Cosmona, page 18), there is the difference between the first and third thoughts only in verbs – „to be“ and „to make“. The verb „to be“ I felt in relation to termination, to wholeness, to action, to shape and quality. This termination by means of the verb „to be“ is justified but not active. To offer human thinking creative development in sense of above mentioned definition, I changed the static „to be“ to dynamic „to make“. Namely, considering that I deal with nonwhole to encourage creative thinking, this verb takes precedence over the first, although it is up to the third in the „Supplement“. An example is the sentence – the Sun heats the stone; the creator is the Sun there. But if I say something has a feature, for example, the stone is warm, it is about the state of the stone, the finished action, which the stone succumbed to. The stone served me in both examples well. So much for the difference between the basic thoughts.

It is appropriate to recall the definition of existence, which I have put elsewhere as follows: Existence – objective reality – does not demand a comparison to whole and at the same time it communicates its physical existence and is not allocated (qualified) to anything else.

What is not whole is nonwhole and is existence.

I. Nonwhole is existence

1. Each thing is either totally devoid of parts (prism, sheet of paper, tone, birth, death, address and other) or is composed of parts. We are taught to cognize all conceivable through. If there is no one to cognize otherwise than by perception, sensual reflection of reality, then it is true that we only cognize through whole. If only what is recognizable through

the whole is within the reach of human understanding, then it cannot be a thing.

The problem is caused by the broadly meaningful noun, a thing that is used in addition to subjects, to express an event, for example. Here I perceive the subject narrowly – objectively.

2. The object is synonymous with a thing. Objects are, among other things, subject to observation. Nonwhole has parts and is also subject to observation.

3. All human images related to the concept of whole are applicable even to nonwhole (except for model-independent cosmona). Human reasoning compares reality to image and model; a particular model creates a certain interpretation of reality. *Specifically, discovered nonwholes will be realities.*

4. Each system ultimately defines whole, but not every whole is a system. The system describes a higher level of knowledge in the defined area. The system, or arrangement, must be characterized by a number of characters that satisfy the conditions, so that the way in which they are arranged can be resolved. The arrangement of the details creates or defines the whole, and thus the system or arrangement are not suitable for describing nonwhole.

5. Nonwhole is not expressible by ideological (idea) abstraction, such as geometry. Ideological abstraction is an idea, on the other hand it is the thought process of man; sometimes it can take a real form by materializing thing or action. Eukleides would surely wonder if his geometry, arithmetic, or stereometry were considered an ideological abstraction.

6. The whole and part are ratios in space. The space does not have content unless the content is limited to whole. The concept of nonwhole implies the impossibility of being limited by space because is not whole. On the other hand nonwhole is existence and existence is a physical existence, which must be located so that it can be described, but it does not have to be rescripted so strictly.

It is a difficult question especially for the discoverer of initiated actions and structures not defined by dimensions and time.

7. Nothing and emptiness have no vastness. Empty room is similar. However, vastness is a metaphysical concept. If we want to add vastness to nonwhole, then we have not contributed to its explanations.

8. Nonwhole is not defined by the extent, area, volume; by these general concepts defining a thing and the thing is the determination of particular matter. It is evident that even nonwhole necessarily has some form of matter but not in the sense 'this here'.

9. If there is no beginning there is no end of nonwhole. Beginings and ends are certain states of things. *Especially the begining could lead the discoverer into a vicious circle of cause and effect.*

10. Nonwhole can be active and act on something else and in something else; if it did not manifest itself or did not show itself, it would not be noticeable. (Only the nonwhole Cosmona does not affect anything else, since apart from her nothing exists. Nothing expresses being non-existent.)

11. Nonwhole is in time. Time is a human need to measure the present moment. They say: time is an attribute of motion. Thus motion is an attribute of time; time and motion are interconnected. If nonwhole is in time then it is never at rest, but only in motion.

12. Nonwhole is related to something else, is in mutual relation with, is relative, but is not orientable; mathematical reference systems are not applicable.

13. For nonwhole it is impossible to create a scheme, a structure initiated by symbols. Both the scheme and also a structure initiated by symbols are instruments of nonverbal communication. Let us consider two popular examples – a map of London underground and Egyptian hieroglyphs; both representations refer to whole.

14. Description of the course of an event will be characteristic of nonwhole. Here I feel a dynamic action than a complete event.

15. Nonwhole is not a subject. The subject, the bearer of attributes, state and activity, clearly refers to whole, which excludes its application in this context. The object and the subject can be regarded as synonyms only very roughly; there is a similar difference between the thing and the individual.

16. What may apply to for a single nonwhole may not apply to another. There are many wholes and nonwholes alike, but not to the same extent.

17. The conception of nonwhole is not based on human value judgements. We commit the greatest mistakes when we assign human value judgements to things.

18. Nonwhole and the paradigmatic science are mutually exclusive. Science we called an activity based on the assumption of the precise repeatability of the given facts based on crutches of paradigms; in other words, it is evidence-based. Fortunately, nonwhole lacks the hallmark of fossilized scientific approach which results from facts stated above and from what will be stated further.

19. If we say, this is a coincidence' we are at our wits' end. It is only the ignorance of the context of actions as we consider a coincidence. We know that the action and phenomenon are still related to the whole and if the action is random for any reason, it is related to the probability of its occurrence. It is impossible to imagine the description and effect of coincidence in the present or future moment. The nonwhole and coincidence are mutually exclusive, too.

20. As stated above nonwhole is in time and I add: has no measurable duration, more accurately, repeatably measurable duration.

21. Nonwhole has no border or a border in the sense of the interface between things, objects. However, someone may ask a question: Is there a border between nonwhole and whole? The question is interesting from the perspective of both whole and nonwhole. As a whole I have it separated from anything else. From the point of view of nonwhole it is apparent that parts of it can also be wholes, even the borders can be the same, but not from the external point of view so as to express myself awkwardly. Likewise, I understand the limit without a touch of impressiveness.

22. Nonwhole has no shape. The shape is materialization, even a thought of an individual thing can be materialized. However, materialization of an idea requires an act of termination and again we are at the concept of whole. The shape does not have to be a physical body, but it always precedes the body. We cannot imagine a physical body without a shape.

23. Nonwhole has no place or position of its own. Here, perhaps, I can help with the adjective „open“. Whoever has ever sailed by sea or ocean knows what the open sea is. The open sea is difficult to grasp from the

point of view of its place of position, but I know what the adjective in relation to nonwhole.

24. From the argumentational point of view I will take advantage of my treatise on the border and follow up on the temperature (except for cosmona).

25. Nonwhole may have a physical or other atmosphere (except for cosmona). The atmosphere of nonwhole can be shared. If I do not want to define, establish, place nonwhole outside any reality, I have to admit also its temperature, but not its room.

26. Nonwhole almost always tends to expand or shrink; it is in the constant process of conversion. Energy production technology in the atomic power plant can serve as an example.

27. Nonwhole is not a thing, that is why it cannot be nor empty or full, but it is some kind of reality among these opposites.

28. Nonwhole both does have and does not have parts; if it has parts, these parts will become wholes in the nonwhole, which is impossible. But what is actually impossible?

29. Nonwhole and the order, rule, norm, instructions. Here I hesitate to write that they do not apply to nonwhole. The first reason is attributes of nonwhole and the second one is the need to communicate obtained knowledge. What is incommunicable, does not exist – in fact, it is communicable, otherwise I would not worry about the concept of nonwhole.

30. No nonwhole will be a multiple of other nonwhole.

31. The reality is determined by object or activity. If there is nonwhole, it is a reality although so far beyond recognition. Consider novels by J. Verne; was it a reality for his contemporaries?

32. In relation to nonwhole the expression ‚borderline case‘ cannot occur; it would be a rough simplification of the observed reality. These are only borderline cases of a phenomenon or an intellectual experiment which lead to expression of a concept or law having either small or big consequences, or, eventually rape a completely different reality.

33. The interpretation, description, explanation of nonwhole will not be linked to physical or other laws which are precise enough to be applied to certain categories of things and phenomena under given conditions; they are limited to special cases.

34. A concept of complementarity – one course of events can be described by two possible ways, and in this case in many ways – enables explanation of the concept of nonwhole. Complementarity on the common level – something acts simultaneously as a wave even as a particle – and on this level acts like a bubble, fragments and the like. It is good to invent new names for multi-modal expression of behaviour, states of nonwhole.

35. Today's people can use the Doppler's effect to investigate blood vessels and organs of the thoracic and abdominal cavities. It will be interesting to observe the influence of nonwhole on this phenomenon. It can be estimated that the change in the observed frequency of acoustic and electromagnetic waves will be more of a source due to nonwhole and its parts. Likewise, due to nonwhole it is possible to estimate one source propagation of electromagnetic waves by means of 'Doppler's effect' and acoustic waves in the 'electromagnetic way'.

36. In today's meaning gravitation is always attractive. I expect that nonwhole can manage to reduce, balance, increase the influence of gravitation. It is, or it will be the effect of non-closure of nonwhole, as I understand it.

37. Measurement problem. We use standards (meter, speed of light, etc.) to verify or measure repeatability of events or phenomena, whenever it is convenient. Further, the means (available regardless of their technical maturity and condition compared to comparable ones) and recognized methods (differing in the nonempirical assumptions of the leading theory) and so on. Nonwhole is not both static or repeatable. I think there will be no problem with measurement. We will not measure.

38. Nonwhole is a masculine singular noun. Nonwhole in plural is impossible.

39. Nonwhole has a lexical meaning which enables to name phenomena and relationships of the lingual and extra-lingual reality. For example, music is an extra-lingual reality.

40. The non-existence of nonwhole is both clear and distinct as its existence; there is no logical contradiction. However, I do not want to shield with logic, because by definition the logic is correct reasoning. But what is ,correct reasoning‘?

II. Nonwhole attributes

The attribute is a symptomatic sing or trait of whole – of a thing, phenomenon – and it effects the sense organ of human organism. It is obvious nonwhole needs the concept of attribute because of the necessity to express a certain degree of specific character, standard or even poetry, although the attribute is entirely associated with the whole. Both signs and effects different from the whole are attributes of non-whole.

Phenomena are events observable by sense. Here I mean not only these phenomena, but also phenomena that we are not yet able to observe. I will give another example: people were observing the photosynthesis and according to its manifestations, they managed to choose food, they just did not know what it was. We can see a lot of phenomena and actions around us and at the same time we are unable to see them.

All of the below mentioned attributes of nonwhole may not occur on nonwholes, actions and structures in full.

1. Nonewhole is different from the whole in above mentioned definitions.
2. Nonwhole is observable, has any form, is manifested by matter.
3. Nonwhole can contain both whole and wholes but with non-dominant attributes, which I name components in the basic definition.
4. Nonwhole is in an atmosphere requiring more detailed specification; it is not in vacuum.
5. Nonwhole affects on something else, even in something different.

6. Nonwhole is in time. If this is true, then it is not at rest, but only in motion. Nonwhole is in a dynamic action.
7. Nonwhole is relatable, but it is nonorientable.
8. Nonwhole is able to exchange pressure, temperature and other physico-chemical quantities on (in) a carrier but does not express itself in natural laws applicable to whole.
9. Each of nonwholes is expressible only in the singular; (it is unique).
10. Nonwhole can radiate information from one source in cubic manner and thus shift the complementarity the order above.
11. Nonwhole is accessible to all human senses including the meaning of prosomen.
12. Irregularities and irreversibility in the metamorphoses, unlimitness, disorderliness will be individually valid (on) in nonwhole.
13. Transformation of the nonwhole into the another nonwhole is possible.

III. Discoverer's language assistant

The name of this part of the work is magnificent but rather boastful; it promises too much and gives too little. I cannot do anything more at this point. Discoverers, thoughtful people, intelligent and contemplative souls will hopefully appreciate the effort to express description of something that is not whole, but has components.

Nouns will be names with ranking features based on the attribute or relationship. For example, I have invented the following: bubblerer, grainrer, fragley.

Verbs will be imperfect in the indicative mood and usually in the present tense. They will also be onomatopoeic, light mellifluent, smell mellifluent, taste mellifluent, palpable and change.

Prefixes and suffixes will become good helpers for both verbal types.

Adverbs will play a very important role. (Scientists requiring strict repeatability of actions should not read any further.) For example you can use: out of the blue, this way, somehow, can, like, then, hereon there, new, gone, deep, completely, at all, it is possible, afterwards, triplicate, together, is need, despote a little, from the bottom, sometime and others.

Interjection. World, wonder! Even interjections. Such as: ow!, oh, thunder, crikey!, oh hello, clang, rustle, plop, whask, go, in a flash, skip, frrr, pad, snip, back, on ward, get out and others.

I hope it will be your pleasure to read this part of the treatise, you thoughtful and poetic souls.

Those who have not yet, for the inability to communicate results of research by the traditional means of expression, considered the results of their research foolish, can rely on the nonwhole.

IV. What the point is.

The point is backward mathematics with its archaic axiom, assumption, initial condition. The concept of nonwhole does not know assumption, axiom. It follows that the problem of mathematics is a problem of necessity to have means of evidence and the problem of the unquestionability of already proven theories and the truths on which it is based. I am always amazed, when I realize the assertion of the undeniable mathematical knowledge, this incontestability, which has never occurred in any other human endeavor, does not occur and will not occur. Humanity, even though through the helix, is still advancing forward.

The problem of evidence known as the dispute between Stoics and Sceptics in doctrine of judgement, which examines what suits the evidence, afflicts other scientific disciplines based on mathematical techniques. One of the solutions, which is my own, is to abandon mathematical techniques, especially equations and build up other expressive means.

The enormous advances in information technologies are the merits of engineers not mathematicians. What grandiose discovery did

mathematicians make? In the Morse code they replaced dots and dashes with zeros and ones, how else than in sequences. I feel sad about mathematicians because their approach to human thinking will never become pregnant.

Nonwhole is not in the game. It is not based on axioms or assumptions, does not require evidence for the proposed theory – there is no theory, it is not the basis of any science and science in general, as we know, lies in paradigms and, as we know, it has a tendency to lag behind with its paradigms, and then, as we know, is replaced by new paradigms that also await, as we know, a merciless destiny.

The equal sign (=) defines the whole. I am sorry to say.

V. On the incommunicativeness of the concept.

It is clear that the concept of nonwhole is in contrast to the concept of whole, but only partially. It is material substance they share in their manifestations. The advantage of the whole concept is in its communicativeness of observed facts. Its shortcoming is the inaccuracy of the description transmitted to different languages, known to linguists, as to scientific interpretation. The advantage of the concept of nonwhole is in the release of means of expression free from the requirements of the scientific description. Its shortcoming is the lack of a training concept of human reasoning, of which this book is the only beginning merely.

THE THIRD BOOK

THERE EXIST ACTIONS INITIATED BY PEOPLE WHICH DO NOT NEED
WHOLE TO BE DESCRIBED AND THEY CAN BE BUT DO NOT NEED TO BE
REPETEABLE

The third and fourth books do not refer to the concept of cosmona.

Some discoveries of initiated actions and structures will make generally accepted scientific truths problematic but they may not be in dispute with current knowledge. However, they will be at a higher level of knowledge and may combine past and present lower-level observations so that they do not substantially alter them. Especially the initiated events will be formed by means of instruments and in the environment of currently valid theories. However, the discovery of an initiated action does not necessarily depend on the most perfect and special apparatuses; it is of course feasible not only in laboratories but also in the natural environment.

What changes is the approach to observation and perception of the environment. The discovery of an anomaly uninterpretable in contemporary science is a view I expect.

A word to discoverers, scientists and thinkers

My discoverer is a person with his own opinion who will resist the normalities, established paradigms, the scientific community to which he has belonged, life in the stream of a comfortable gray average.

I think the discoverer has already in some form encountered the events and structures listed in other parts of the treatise. In order to see what I want him to see - initiated actions and structures independent of dimensions and time - depend on what he is observing. Mastering the supplemented foundations of human thinking and at the same time to unlearn seeing the ways he was trained to see; new interpretative techniques arise from such a vision. The discoverer avoids non-empirical

assumptions, assumptions in general, and evidence, and his records are mainly of a qualitative nature.

To reject the paradigm and not to replace it with others is to abandon science and scientific work in today's concept. Discoverers of the structures and actions initiated here will have to face similar decisions and abandonment of professional careers.

Discoverers will offer certainty in the existence of initiated actions and structures not defined by dimensions and time.

I. On the content of the concept

1. I do not consider spontaneous and spontaneous events and their interaction in nature to be initiated. I will give two simplest and most abundant examples - the riverbed of a meandering river and the effect of an iceberg on the Earth surface.

2. Initiated action in nonwhole is an action if it actually exists, is sensually perceptible and empirically verifiable. In particular, its verifiability will depend initially on consensus among discoverers. The link between discoverers will be a consensus on knowledge instead of demonstrating the scientific repeatability of the initiated action.

3. Initiated actions generally do not use the classical notion of reality, according to which the initiated action (and the object of observation) should have a definite history.

4. Since we do not yet have a description of what is being initiated nonwhole here, we do not have its variables. Maybe we will not need them at all; maybe we can do with the variables - a bit, a pinch, in a while, not too fast, slightly warmed up and so on.

5. The initiated action in nonwhole is continuous, it is in an interrelated relationship. This relationship is just the discoverer's discovery.

II. On the cogniton

6. In the description of the initiated action we do not seek control activity. The discoverer will be initiate control activity.

7. In a single moment, a phenomenon can be observed, a process that has not yet been plausible for lack of information to ensure strict repeatability of the phenomenon, action. Such a phenomenon, the action is like a complexly described bubble. It is necessary to boldly record the fleeting moments of knowledge that will serve as the first knowledge of the action in both the nonwhole and in the whole and initiated action of itself.

8. Discoverers of initiated actions will first have to handle the role of observer, especially those events that have happened unintentionally; as others say – fortune favours the prepared. These events are unlikely to repeat qualitatively and quantitatively.

9. Initiated events will first be discovered and subsequently initiated, 'Something' will be discovered, evokes the idea of the thing, of the whole. Nonwhole will not be discovered as a thing, but let's say as a 'function' in sense of action. The observer will gradually become the initiator of events implemented on the nonwhole.

10. We are not looking for simplification for the interpretation of the initiated action.

11. Can we ask ourselves the question: What happens if...? The question is correct if we interfere with a change, for example, I am putting salt.

12. In describing an initiated action, it is unacceptable to invoke natural laws, universals (general terms) and established characteristics. Here we will also use the discoverer's language assistant listed above.

13. Changes in initiated actions will not be permanent, but always temporary, approaching equilibrium because of some stimuli.

14. Initiated actions will be perceived both directly and by instruments. Apparatus, however, greatly depreciates knowledge as they are designed to capture physical and chemical quantities and, secondly, they interfere with action, phenomenon and observer. Devices are just a tool to perform the tasks for which they have been designed.

15. If we describe the initiated action in a communicable way, then it will be necessary to work on the probability of its occurrence.

III. Definitions

16. Initiated actions in nonwhole appear in different ways; but I have not expressed much, but I have to express it like this.

17. The discontinuous behaviour of the initiated action makes no sense, it does not describe the action I have in mind.

18. Some of the actions initiated will roughly repeat on for approaching regeneration processes; they may initially have a similar sequence or result.

19. Initiated actions are knowledgeable, unique, positive, certain, infinite; the result of the initiation is an experiential opinion.

20. The initiated action cannot be characterized by physico-chemical or any other process. The state is the end of the action.

21. The effects of initiated actions become their attributes.

IV. Considerable reflections

22. The entire description of the initiated action will only be in the present tense - I can see, feel, or just in the past tense - I saw, felt. I prefer the description in the present tense.

23. I do not demand the repeatability of the initiated action, but I require the achievable accuracy of its description because in a month, several years or decades, someone else else may describe almost the same initiated action elsewhere; although it allows the possibility of misuse by jokers and dishonest people, but it is also true today.

24. Currently, I cannot judge how much the initiation of the action will be related to the microscopic level of research.

25. The initiated actions of mutual transformation of forms of matter and energy and their spontaneous, stepless but uninterrupted reversals of these transformations will be described. The description I mean is at the level of human senses not the device-mediated description by instruments.

26. Neither biology nor botany, generally speaking any human exploration, can avoid initiated actions. It seems to me that even super slow actions will increase in importance in this area of creative activity. I just emphasize that no discoverer is a priori excluded from participating in the investigation of the initiated action, independent of the whole, which may not be repeatable.

Welcome here!

THE FOURTH BOOK

THERE EXIST STRUCTURES WHICH ARE NOT DEFINED BY DIMENSIONS AND TIME

I asked myself a question: Have any problems been raised that I am solving by the initiated actions and the here considered structures? Yes, they have. Namely. We miss a deeper understanding of nature, the universe still tied to the creation of a mathematical description known as the application problem of new knowledge.

I. On the content of the concept

A structure that is not delimited by dimensions and time, as I feel it, is something that is recognized at first glimpse, then piece by piece, and suddenly emerges from the depths of what one of the human senses has captured to make another sense enlightened and to start to riddle a quick kiss of knowledge like a puzzle.

Our structure is more of a structure than an arrangement, it is based on relationships rather than on the arrangement of components, creating an internal network rather than a way of composition.

First, the ways of thinking are refined on these foundations and only then each discoverer will be able to describe the structure. The foundation is in the preparation of reason for events, whether seen or felt, but not yet recordable to fix the necessary dimensions and time components in our thoughts.

I think there are structures in which it is not necessary to solve whether they manifest themselves in the whole or in the nonwhole.

The structures will be different.

II. On the cognition

1. One of the universal, distinctive characteristics of our structures is that they are neither delimited by the dimensions nor by the time that they do not need any size or the passage of time to describe them.

It is impossible for human knowledge, reason and intuition, to think of such a priori structure.

2. If no influence of space and time has yet been observed on the existence of the universe, such an influence will not be observed ether on the structure unlimited by dimensions and time.

3. The structures here are and will be a reality; the structure is the concept of this reality.

4. Structures must be concrete and have a material substance.

5. Structures cannot be solid.

6. Structures cannot be the result of a thought experiment if the basis of reason is self-dealing, if it is of a metaphysical nature. Our phenomena are subjects of experience.

7. From metaphysics, we know that space and time are so-called pure opinions, synthetic knowledge, excluding any sensory basis lacking experiential content of impression. (Interestingly, mathematics takes precisely the pure view of space and time as the basis for its considerations; its part of geometry takes space; arithmetic then creates numerical terms and relationships between them by adding units in time. Mathematics prescribes how to look at the world and what views to hold.)

8. Structures of unspecified dimensions and time will deprive us of the linear way of describing a known fact.

9. "Intangible reality" exists and is immaterial only because we cannot identify it as matter mainly through the senses and technical means.

10. Nothing prevents the structures from being closed and open. One can also imagine a structure enclosed in one direction and open in other directions and vice versa.

11. I don't think any structure could be a model for another structure.

12. Structures have surroundings, are in an environment of a certain kind, have their own or shared atmosphere.

13. It is not permissible to merge a structure only with its location.

14. Nothing prevents structures from being static or dynamic; if they are static, they can manifest themselves as a clockwork, if they are dynamic, they can manifest themselves in shrinking and enlarging, that is, decreases and gains, and consequently can be distinguished.

15. Structures will be discovered (DNA helix) and then actively and passively formed (interstellar cloud structures).

16. The question is whether one structure may occur "next to" one or more structures. The question is open.

17. Biological structures will be discovered through biological perception. The sixth sense of prosomen will be involved in biological perception without chemical or physical insight.

18. I assume knowledge of something other than the wavelength of electromagnetic radiation. Thanks to new knowledge, unknown phenomena become observable, as structures do.

19. It is likely that we will need a different correlation to describe structures that are independent of dimensions and time.

20. Although today's mathematics is defined as a science of structures, it will be almost useless to express the structures.

21. Structures are time-independent, that is why reversibility will not limit them.

22. The problem of structure duration is irrelevant due to its definition. If we talk about speed, then only with neglected time. Excluding time also means eliminating all types of equations and inequalities from reasoning with all the implications for the knowledge described.

23. We say goodbye to time, let us say goodbye to dimensions. Galileo Galilei discovered that the laws of nature would change with a mere change in standards; This is their incredible handicap. Our structures without dimensions and time will be less bound to the science of today's concept and to the clay feet of the so-called natural laws, to the models of their problems and models of their solutions.

III. Postscripts

24. The unification of structures is far distant music or they will never be united in the sense of the kind, but perhaps it will be possible in terms of working practices.

25. Let me mark our structures as sentiment structures. The emotion structure will express personal importance.

IV. The discoverer's forbidden fruit

It is just an allegory, of course. I would like to gently highlight pitfalls of ideas treatment and the practical work with nonwholes, initiated actions and structures, and I also want to provide a lifeline to fall back into the arms of stoic colleagues.

For the discoverer, the world, nature is disordered.

Every fact is of equal importance to him.

The discoverer does not seek to operate a new science.

It does not seek to determine the rules of description of nonwhole, initiated action and structure.

He does not try to adapt the anomaly to any theory, he does not adapt nature to his opinion or to the views of the scientific community that he has belonged to.

It does not suppress novelties or anomalies, nor neglect them, but mainly does not adapt them in favor of something.

It does not specify what kind of knowledge is to be excluded from the description, what the knowledge cannot contain, what is too problematic, what will not be interesting, in other words what is or is not important and also what exists or what does not.

His subsequent observation does not lead to a more detailed subdivision.

He does not focus on what it is, how it is created or disappears, but how it manifests itself or how it behaves.

I suppose that the discoverers will not establish any communities at least in the beginning, let alone scientific.

So much about what will no longer be said.

OWN TERMS, DEFINITIONS AND STATEMENTS

1. There exists something that is not whole but it has components.
2. There exists something that is not whole but it has components; the universe is one of the Cosmona components.
3. Everything that takes effect is a constituent of Cosmona.
4. Cosmona is the only reality is independent on a model.
5. There exists something that does not make whole but it has components.
6. They exist action initiated especially by people which do not need the whole to be described and they can be but do not need to be repeatable.
7. There exist structures which are not qualified by dimensions and time.
8. Existence - objective fact - does not demand a comparison to whole and at the same time it communicates its physical existence and is not allocated (qualified) to anything else.
9. Gravitation is connected with those elementary particles which are incapable to employ their total bond energy inside mass, the part of which they are.
10. Prosomen is a brain ability to send and receive warning signals aimed at a person and a living creature. The power of signals is determined by emotional relationship between them.
11. Prosomen - the sixth sense of 'physical' nature will highly broaden the human ability to communicate and, perhaps, it will help to understand better „the language“ of animals.
12. The wavelength of electromagnetic radiation ceases to be the basis of knowledge of unknown forms of mass today.

13. Something different from matter and energy, from which other universes are grouped, is called cosmonium.

Conclusion

It seems to me, dear reader, that I have said more than needed, because beauty of a thought is brief. I deleted much and added a little so as not to distract you from thinking. I can find beauty of knowledge in words we adopt, and we continue to provide them with ease and smile like our own because of the pleasure of devotion. What else can you wish?

Reader, be healthy!
