

On the Concept of Cosmona

Existence which is Hope for Mankind

Rudolf Polách, 2015

On the Concept of Cosmona

Existence which is Hope for Mankind

ON THE CONCEPT OF COSMONA

Existence which is Hope for Mankind

More than a hundred term definitions provide space to get acquainted with fundamental ideas. Turning away from etalon science to a science of flexible knowledge is hope for mankind.

Preface

Everything that moves makes all effort to make living to preserve its animal species or family. Most of animals hardly keeps in mind at least one of parents. Only the man is able to experience even five generations of relatives. It is not suprising that the man tries to protect his/her family and families of children with whom he/she is in contact. His/her mind and efforts concentrate on the period of a hundred years, thinkers and scientists are not an exception.

Cosmology is a science about the universe. Cosmology considers the universe whole and especially follows from suppositions saying that physical laws valid for the Earth are also valid for the entire universe: the universe is the same on a large scale, the amount of antimass is the same as of mass. Using mathematics, models of the universe expansion and cooling, leading somehow or other to the collapse of the universe and mass disintegration, arose from the above mentioned suppositions.

Theologists offer immortality, while scientists of these days only about seven milliards years of the universe existence, and thus preservation of their genetic information in future generations.

The universe does not need an offer. Thinkers are mistaken by considering the universe whole. Scientists are mistaken by describing the universe on the basis of simplifications, suppositions and axioms.

The here treated cosmona being (a part of which is the universe), which is not whole and is not based on suppositions, is the prospect of permanent human existence, if wished for.

Author

I. Whole, most natural human conception

Is it possible to preserve the human race forever, even after the end of Solar System?
Yes, it is. Cosmona is the key.

All human conceptions are conceptions about things and phenomena describing whole and its components in relation to the vicinity in the causal relationship - causes and effects, conditions of nascency and extinction, and duration. The conception of self, of the man in his uniqueness, of whole have been introduced into everything which is cogitated, examined. This prevents us from cogitating possibilities of existence before and after our being in a different way than within the framework of beginning and end. Generally, it is either conscious or unconscious allocation of human attributes to things and phenomena faced with the human lot of birth, life and death. Human knowledge, passed from generation to generation orally and in written form or by means of artifacts, being either accepted or refused in various places on the Earth or in various historical periods up to now, is the source of

conceptions. Truthfulness of conceptions is determined by a level of knowledge and the power of prejudices of an individual or a group he or she belongs to, whether it is a profession, community or culture. Many conceptions have become dogmas and paradigms, to the detriment of human cognition. Protagoras is right anyway: "Man is the measure of all things: of things which are, that they are, and of things which are not, that they are not." A paraphrase can be made: so far whole has been the measure of all things. Whole thrones over everybody and everything.

We must get free of Aristotle's Metaphysics since his conception of beginning, causation, nub, nascency, extinction, place, being, substance, hypokeimenon, per se, existence, whole, etc., is not compatible with cosmona. The treatise on the concept of cosmona is not related to cause and effect. There is no relationship between a past experience and a present fact from which cosmona can be inferred, there is no experience by means of which cosmona can be described. Comparing two things, two pieces of experience, two thoughts about the same is the core of the matter. Since Antiquity up to now philosophy has been based on a comparison if there is a difference, and a distinction if there is a sameness; that is the reason why philosophy is not of any help when defining the concept of cosmona.

The truth lies in accordance of an object with its concept, however, cosmona is not a subject or an object. The truth sustained on the instant is better than that sustained by a proof since each proof stems from a certain set of assumptions, axioms, whereas the truth about cosmona does not; it stems from a natural glance on the sky, one of her parts - the universe. The belief in one universe evokes the belief in another universe rather than in cosmona. This is natural human reasoning based on experience. I do not present a new hypothesis or a theory, just eliminate black and white vision of numerous things including the universe. It is important to realize that a man is not a measure of all things and actions and to give up this genetically encoded idea. The existence, which is hope for mankind, I call cosmona. One of the worst philosophical mistakes of all periods is qualifying rest in relationship to inanimate mass.

II. Contemporary disciplines on the universe are based on assumptions

They are especially these assumptions:

1. usage of the assumption something is at rest
2. phenomena linearization, simplification of scientific reflections
3. corrections make usual parts of mathematical processes
4. connected material system – body, substance, field
5. system of mass is spatially restricted
6. homogenous and spherically symmetrical gravitational field of the body
7. large scale universe is constant and homogenous at all points
8. models of the universe are of geometrical nature

9. selection of certain kind of radiation coming from the universe in the course of physical measurements.
 10. ignorance of gravitation substance and electromagnetic radiation is being neglected
 11. course of time influences space
 12. speed of light in vacuum is constant
 13. there is density, pressure and energy in vacuum
 14. existence of complex thermodynamic balance one second after the big bang
 15. relic radiation of last dispersion was not influenced
 16. leaving the principle of action and reaction in considerations about the past and the future of the universe.
- Last assumption is being concealed in cosmology considerations.

Scientific considerations cannot avoid mathematical means. Reduction of any mathematical structure in which a derivation is required, is always n-dimensional Euclidean space. Simply, a mathematical structure expressed by calculus is always rigorously local. The mathematical calculus is based on the assumption of monotonous natural courses; on the assumption contradicting experience. As Kurt Gödel states - concepts such as class and whole do not guarantee indisputability of any single system which is based on it (incompleteness theorems).

Contemporary space disciplines are not indisputable.

III. Supplement to basic elements of human thinking.

I define:

1. There exists something that is not whole but it has components.
2. There exists something that is not whole but it has components, the universe is one of the cosmona components.
3. There exists something that does not make whole but it has components.
4. There exist actions initiated especially by people which do not need the whole to be described and they can be but do not need to be repeatable.
5. There exist structures which are not qualified by dimension and time.

Cosmona is not based on assumptions, otherwise I would have to demonstrate that dictum about cosmona are inevitable logical inferences of initial assumptions. Human thinking compares a fact with an image, a model. A certain model creates a certain conception of reality. Cosmona is the only reality which is independent on a model and it is not philosophy.

IV. Negative expression of cosmona.

Negative expression of cosmona means to imagine the opposite of her much more easily. Cosmona is not whole, it is a negative fact. But this dictum is a positive fact; to understand this fact: we know what whole is, hence we can cognize cosmona. We are unable to define that there is not anything if we say "something". However, we can say "something" is different from what is left. Cosmona is not whole - thus we say cosmona is different from whole. Cosmona is not whole, she is a judgement, namely a final judgement. Two judgements about cosmona cannot exist because there are not two cosmonas.

6. Cosmona is not a thing nor a concrete object.

Cosmona is not a thing because it is not whole. Cosmona is different from everything that is within human understanding at present because we are taught to cognize everything conceivable via whole. In that way we also cognize the universe without being aware of the fact it makes part of cosmona.

7. Cosmona is not an unknown thing.

8. A concept of cosmona does not correspond to a cosmona object; cosmona is not an object.

9. Cosmona is not the object of observation.

Only her real components - the universe and so far unobservable universe that is not within the reach of contemporary means and capability - are objects of observation.

10. All human pictures relating to the concept of whole are inapplicable for cosmona.

11. Cosmona is not a system.

As a consequence, each system qualifies whole. But not each whole is a system. A system describes a higher level of knowledge in the defined sphere. The question is: is cosmona a system? We know cosmona is not tied to certain conditions. Cosmona expressed in this way is not a system, nor an arrangement.

12. Cosmona is not expressible by idea abstraction, for example geometry.

13. Component and whole are proportions in room; both whole and room have nothing in common with cosmona.

14. Cosmona is not qualified by room.

Room has not a content if it is not qualified by whole. Qualifying the room for cosmona means existence of other room, which contradicts her all- encompassment. This excludes extra room.

15. There is no empty room inside cosmona.

Nothing and emptiness have not spaciousness. Mass, which is physically definable, does not contain all mass in the universe and consequently in cosmona. Present opinions fill up the empty room with omnipresent dark mass. This sentence applies to

vacuum.

16. Cosmona is not determined by an extent, area, volume.
17. Cosmona does not take an active part nor a passive part within the meaning of human activity.
18. Nascency and extinction are separated from cosmona; this excludes the prime mover and the moved. It is change that remains.
19. If there is not a beginning, there is not an end of cosmona.
20. Uniformity of changes as an assumption does not apply to cosmona.
21. The theme of reflection on cosmona is not whether mass transitions from one configurations to another are spontaneous, by jump or both simultaneously.
22. Cosmona does not affect anything else, since apart from her nothing exists. („Nothing“ expresses „to be nonexistent“)
23. Cosmona is not in time, at rest or in motion.
Time is a human need to measure the present moment. They say: time is an attribute of motion, otherwise motion is an attribute of time; time and motion are interconnected. According to contemporary understanding there is no opposite of time whereas there is the opposite of motion – rest. If we take a think, time determines both motion and rest, while rest is not probably able to determine time. There is a contradiction and as a result motion is deprived of time.
24. In cosmona there is not rest, even none of her parts is at rest, everything is in motion.
25. Cosmona cannot be interrelated to anything else, there is nothing like that.
Relative systems do not apply to her.
26. Cosmona is not a subject.
The subject, an attribute, state and activity bearer, is clearly interrelated to the whole, which excludes its application in context of cosmona.
27. Cosmona is not a multiple of the known universe .
Somewhere else universes can be of different character and composition. Our universe can be composed of several universes mutually overlapped.
28. We will never have an absolute cognition of cosmona.
29. In cosmona observed facts will never repeat neither qualitatively nor quantitatively.
By their analysis we obtain at most certain knowledge which still be an excellent result of deduction.
30. The conception of cosmona is not based on human value judgements.
31. Cosmona is not nature, natural or naturalistic.

So far nature is philosophically restricted to the planet of Earth.

32. Science of cosmona will never be a science of proof based on assumptions, axioms.
33. Determination of cosmona is not another cosmology.
34. Cosmona is not identical to anything else, she is not similar to anything else.
35. Cosmona is not described by a coincidence.
If we liberate nature, universe, cosmona from human view, then there is no coincidence. We only consider our ignorance of chain of events a coincidence. We have vested coincidence with the probability theory, however without it life would lose interest.
36. For cosmona it is impossible to create a scheme, a structure indicated by symbols.
37. Cosmona cannot be connected by mutual interaction to any system because she contains everything real.
38. We cannot obtain integral picture of cosmona because a picture is whole.
39. So far we are unable to describe both the universe and cosmona.
However what will be possible for the universe one day, will never be for cosmona; this is the point of divergence.
40. Observing cosmona we cannot ask a question: what is happening if ...? The question results in an inadmissible consideration of cause.
41. Cosmona cannot originate from herself and become extinct in herself.
Since there exists nothing outside her, the consideration of her nascency from something that is her constituent is impossible. There is no opposite of cosmona.
42. Cosmona cannot have a form of time; there is not a history of her.
43. The future of cosmona is impossible to anticipate by human observation. She will always exist.
44. We cannot separate cosmona from the cognition of the world, the constituent of which we are.
45. Cosmona does not contradict the truth given by the level of cognition of the universe.
46. Cosmona has not a sphere of effect.
Cosmona contains everything therefore it is impossible to define a sphere of her effect.
Everything that takes effect is a constituent of cosmona.
47. Cosmona has not borders or a border in the sense of dividing line among things, objects. Similarly we understand a limit, too.
48. Cosmona has not edges; edges are limitations of a body.

49. Cosmona has not a shape.
If a shape is connected with a body and a body is definitely the whole, then cosmona has not a shape.
50. Cosmona has not her place, a position.
51. Cosmona cannot exchange a temperature with anything.
52. Cosmona has not her physical or other atmosphere.
The atmosphere is connected with vicinity to something, the whole.
53. Cosmona has neither increases nor decreases.
It is impossible to add whatever from somewhere and to remove whatever to somewhere.
54. Cosmona does not tend to expand or shrink; she is in an uninterrupted process of transformation. Generally, there is no tendency of what so ever.
55. Cosmona has not an opposite, an antipole, a contrast, it is impossible to differentiate her.
56. Cosmona contains neither „emptiness nor fullness“.
57. Cosmona has not evenly spread mass, as shown in images of galaxies of her component: the universe.
58. No cosmona component has her proper, specific function.
59. Cosmona has not a final lists of components, she will be resistant to a final description.
60. Cosmona has not an order, a rule to follow.
61. Search for a source or an origin of cosmona has no meaning.
62. We cannot view cosmona as a reflection of logical structure of planets, stars, galaxies at a certain state.
63. Cosmona neither increases nor decreases.
64. Cosmona neither shapes nor evolves.
Cognition of cosmona evolution would mean a fixation of both initial and certain achieved states, which is impossible. If there is no beginning, there is neither a momentary state nor an end of cosmona.
65. Cosmona does not move any sort of motion.
Cosmona has not a motion. Only the whole can be localized with respect to other wholes or to components of another whole. Both spatial localization – something is somewhere- and general one – whatever is always somewhere – are meant here.

66. Cosmona does not perish, as she does not originate, she does not become extinct.
No component, in its variety, can cause her destruction, no matter if a component or the other one is becoming extinct, changed.

V. Positive expression of cosmona

It is not possible to create an opinion about something that does not exist. We cognize only things that exist, we cognize cosmona. Clear understanding of cosmona through the existence of universe is a unique, unrepeatable and prolific process of every reader's thinking unencumbered by paradigms. It is not decisive whether our universe is composed of more components or it is an inseparable whole.

67. There is nothing more than cosmona.
68. In cosmona only irreversible actions are in permanent progress.
69. Cosmona is a natural fact, cognized and verified reality.
70. Cosmona is a reality and phenomenon perceived by senses.
71. Cosmona is a reality, however, not in a sense of an object, subject or thing.
72. Cosmona is described by a concept of existence.
An existence – an objective fact – does not demand a comparison to whole, and at the same time it communicates its physical existence and is not allocated (qualified) to anything else.
73. Cosmona is original, unique, all-encompassing, her full qualification is impossible.
74. Cosmona appears different from herself, if she were different from the other one, she would not be unique.
75. If we create an opinion about cosmona, she is conceptually defined.
76. Cosmona is a object of perception and thinking.
Thinking is not possible without an image. The image of cosmona is nonwhole, the opposite to whole.
77. Cosmona constantly lasts, though she substantially changes in one of her components more than in another.
78. Cosmona belongs to the sphere of phenomena and is prepared to a mathematical description which will always be only a partial one.
79. Cosmona is a phenomenon, if she is really existing, perceptible by senses and empirically verified at least in one of her components; the universe is the component.
80. Being of cosmona is possible; her full understanding is limited by knowledge and the approach to knowledge.

81. Being of cosmona is impossible if considered as whole.
82. Being of cosmona is necessary, otherwise Demiurge's creative dispensation of all known mass must be admitted.
83. Being of cosmona is truthful by her nature.
Her truthfulness can be verified by a look at the night sky.
84. The reality of cosmona being is connected to the reality of universe existence.
This way the existence of cosmona is acknowledged.
85. If we say that cosmona exists and therefore something always happens, it does not mean that consequences of the happening can be interrelated to her in the casual proportion.
These happenings can only be interrelated to one or a few components of hers.
86. Cosmona is a correct opinion about the state of „the world“, the component of which is the universe.
87. Cosmona is „indifferent“ to human laws of nature.
Considering present and future cognition of laws of „nature“ to be of binding force for the universe and cosmona is not only unscientific but also foolish, as you can verify by looking at the state of knowledge a few hundreds years ago.
88. Cosmona is independent on the conception of time.
Time is dependent on the existence of mankind, eventually on extra-terrestrial thinking beings. At times when people did not live on Earth, there was nobody to need time.
89. Cosmona has a limit in the sense of determination of activity extent .
Unrecognizable possibilities of real transformation in cosmona's components are limits of activity extent. Cognition has similar limits, too.
90. Cosmona is unlimitable.
Existence of a limit would especially determine her, like any term defining limitation.
91. Cosmona is characterized by irregularities in her transformations.
92. In cosmona inexhaustible spontaneous actions of transformation of mass, energy and cosmonium proceed.
93. Illimitability of cosmona is involved in the continuous division and merge of mass, energy and cosmonium.
94. I call cosmonium something that is different from mass and energy, from which other universes are composed.
95. Cosmona permanently goes through an unorganized and irreversible process.
Existence of an organized state of a system is a starting point for an observer.

Everybody may acknowledge that the observable universe cannot be its initial organized state. Any observable part of the universe will always be, in this sense of meaning, an unorganized and irreversible state making impossible a sequence of actions in an irreversible order.

96. Phenomena in cosmona are interconnected; are in mutual inner relationship, they are directed from one to another, without the existence of final states of phenomena.

97. In cosmona a rest is an unknown state.

98. Actions in cosmona are unrepeatable.

Our experience of deduction verges to a certainty that some actions will repeat, that they will have an exact or at least approximate succession or a result. The applied way of deduction is invalid for her.

99. Cosmona stability is safeguarded by regeneration processes.

The same types of dark mass, interstellar clouds, universe bodies and cosmonia with the same attributes always appear.

100. Mass in all forms is the only cosmona limitation. It is only mass that is able to qualified her.

101. In cosmona entropy is constant.

Cosmona is not whole and system, therefore it is impossible to apply reflections comprising an isolated system and its entropy. If untidiness is constant, tidiness is instable.

102. In cosmona some of her components can remain in a state approaching stability as long as possible which will collapse with the probability that equals one.

103. Cosmona is time blank.

104. Cosmona is permanent, unlimited by time and room.

If we say cosmona is infinite in room or time, we would make two mistakes. First of all, we would consider her unlimited in many ways of human understanding, which is certainly completely vague and, from our point of view, also incorrect. Secondly, there is also a beginning in the infinite; something can finish because it began. The beginning of cosmona is a priori excluded, if it were not, we would not differ from theologians.

105. Cosmona has components, but she has not a final list of components.

106. In cosmona permanence of changes is her integral determination.

107. Cosmona existence is proved by a relic radiation from the universe.

If there is a background, then whole is defined towards something different. If the term of „the cosmic microwave background radiation “ is used, then something cosmic on some background different from the universe is discovered.

108. No problem for mankind arises from the existence of cosmona, on the contrary, she

is the hope for mankind.

VI. Cosmona attributes

Necessity to communicate mutually about cosmona raises a need to express her attributes, even if an attribute is a sign or characteristics of whole.

109. The basic attribute of cosmona is to be in a permanent change which is nor a proper arrangement nor an order.

If an order in cosmona is considered, then it is unambiguously the change; put another way, in cosmona there is an order of permanent change.

110. Cosmona is a bearer of cosmona attributes, especially uniqueness and permanent variability of her mass and cosmonia.

111. Cosmona can have a common cosmona attribute with another body or phenomenon, if this attribute is accessible by observation.

112. There is not a relationship between a shape and attributes of cosmona.

If a shape is connected with a body, and cosmona is not whole, in this case cosmona does not have a shape and consequently a relationship between her shape and her attributes.

113. Categories of identity and difference are invalid for cosmona.

The statement, that there is a difference between existences, assumes that existences have at least one attribute, a state, etc.. – a certain identity. Things and phenomena have at least a common basis. A conclusion about differentiation of cosmona cannot be deduced from the premises.

114. Cosmona neither gain nor shed attributes.

As mentioned above, there is nothing to gain from and to shed to.

115. Crucial cosmona attributes, actions and structures mentioned in definitions of III. section are:

- difference from whole
- perceptiveness
- existence
- uniqueness, originality
- all-encompassment
- nondeterminability
- durability
- connections in metamorphosis
- irregularity in metamorphosis
- irriversibility
- independence on time
- unlimitness
- disorderliness
- inorientability

All above mentioned attributes do not need to occur in full extent on newly described nonwholes, actions, phenomena, structures, etc..

VII. Metaphores

Creating a good metaphore means to observe analogies between things or events. However, cosmona is not a thing or an event, therefore it is impossible to describe her by means of a methaphore. Nevertheless it is necessary to explain the reality of cosmona to the reader.

116. If we were to use a methaphore, we would say that cosmona works like a clock mechanism – a clock perpetum mobile – in a certain sense in one-way direction.
117. Cosmona, metaphorically speaking, is an example of the highest of all infinite numbers; she contains everything and it is impossible to add anything to her and to detract anything from her.
118. Actions in cosmona can also show herself „deformationly“, for example like a motion of a baby in mother’s belly in a high stage of pregnancy. Bumps on mother’s belly appear here and then, once or more times, irregularly, etc..
119. A motion of a school of fish is an example of perfect informedness and motion coordination. If a piece of information is replaced by Gravitation Law and coordination by a resultant of mutual gravitation forces, it is a rough visualisation of actions in cosmona.
120. Cosmona can be expressed by areas generated by Fermat equation $x^n + y^n = 1$; for $n = 3$. A disk of solar system can be simply understood as a graph area.
121. Cosmona can be characterized by water conversion phases.
122. Cosmona can be hyperbolically compared to human consciousness.

VIII. Comments on grammar

A detailed content of the concept was determined by two fundamental predicates mentioned above. Basic orientation in the text is determined by order of individual sections with an emphasis on definitions. Comments respect a usual process of explanation from known to unknown. Topical units can be found in the sections. The form of comments on sciences was chosen to allow the reader to concentrate on reflections on each definition, and at the same time, to enable expression of the other ideas.

1. Cosmona is a feminine singular noun.
2. Cosmona is a fact expressed in a linguistic way.
3. Cosmona is a bearer of lexical meaning which enables description of events and relationships of so far extralinguistic reality, and will be subjected to lexicalisation.

4. If we say cosmona exists or simply there is cosmona , it is grammatically wrong. We should say correctly: cosmona exists through the universe, one of her components.
5. Cosmona should not be considered as a word purely professional but as a general word, perhaps, one day, a popular one.
6. „Imprecision“ of the concept significance enables its significant elasticity and effectiveness, it has a generalized meaning.
7. Cosmona is a verbal sign. There is an indirect interconnection between the form and the context in human consciousness, an analogy to another sign – cosmos. The relationship between them emerges on the basis of phonetic analogy in the sphere of significance both in Czech, English and other languages.
8. The verbal sign of cosmona is close to the popular model of the universe. A steady-state comparison between them will not be possible, since the universe can only be deduced from cosmona, not the other way round.
9. I suppose formation of living verbs in connection with the usage of the expression of cosmona in the artistic and imaginative literature, it means words expressing activity and commitment with a positive approach to the fate of human race.

IX. Comments on philosophy

1. I explored the problem to preserve human race in the following way:
 - 1.1. The effort to specify the universe has failed because of differences of cosmologies. Doubts has been intensified by the differences in estimated age of universe and the half-time of proton.
 - 1.2 Individual cosmologies have the same abstract mode – they all result from assumptions.
 - 1.3. The elimination of assumptions from considerations outlined the possibility to distinguish the reality in a new way.
 - 1.4. I reached the reality unburned by human fate.
 - 1.5. The new reality has not yielded the concept of rest and whole.
2. Primitive concepts, which are considered to be indefinable, cannot be used to qualify cosmona. It is impossible to say that something is of a certain quality because if the „something“ is said, it is whole. The „something“ defined in III. section is different from whole.
3. The reality is determined by object or activity. If something exists, it is a reality, although so far beyond recognition. Cosmona is the reality of the nonwhole; her component is known.

4. Concepts of whole and nonwhole are permanent in every day speech.
5. The nonexistence of cosmona is both clear and obvious conception as her existence; there is no logical contradiction.
6. It is impossible to prove incorrectness of the perception cosmona is not whole. Similarly, it is impossible to prove incorrectness of the perception the universe is whole. The perception of cosmona goes out perception of her component – the universe.
7. Per se (hen) and existence (to on) are the same for Aristotle. The interconnections of manifoldness (polla) and per se, existence and nonexistence lead both to whole and nascency or extinction. In spite of the fact that Aristotle considers changing reality to be existent, it is impossible to use his concept of per se and to on.
8. Truthful knowledge about cosmona does not proceed from cause to effect. The cause and the effect suppose that something is being changed by something. There is no cause which influences cosmona.
9. Phenomena are events observable by senses. Not only these are comprised, but also those so far unobservable.
10. Cosmona is thought, written and spoken about; she is a subject of research.
11. If a general law which should direct everything is searched, it is wrong because a regulating activity is expected, as generally known, it is not anything else but a primary cause. The fact that cosmona is in a permanent change and simultaneously is not whole and simultaneously nothing exists apart from her, does not require a regulating activity. (The comment is dedicated to Immanuel Kant.)
12. The expression „nothing exists“ is used. Nothing is a negation of a negation - a positive. Nothing exists can be misinterpreted in the sense that nothing exists, there is nonexistence. The problem is raised by the concept of nothing which is clearly understood in this way: nothing excludes the existence of whatever.
13. Cosmona and mass are independent on human consciousness, consequently they cannot be limited by consciousness.

X. Comments on physics

1. Determinations do not cover details of cosmona; plenty of indisputable pieces of information provided by her component – the universe, are sufficient enough.
2. Simplification is not searched to explain cosmona. Limit cases of a phenomenon or an intellectual experiment result in defining a conception or a law having either small or great inferences. For example Euclidean or non-Euclidean geometry applied to the universe, validity of physical laws limited to special cases, etc..
3. Physical laws are precise enough to apply them to a certain categories of things and

phenomena under given conditions. A question is raised if some of the contemporary physical laws can be applied to cosmona. The greatest problem probably arises with the 2nd sentence of thermodynamics and the energy conservation law, if the precise equivalence between mass and energy is valid.

4. So far no influence of time and room on existence of universe has been observed; the same also applies to cosmona.
5. It is the same for both time and room; they both neither decreases nor increases (illustrative comment).
6. Each of existing things has volume. Room does not exist, it is only occupied volume that exists.
7. As follows from the character of quantum mechanics, a system, the part of which, is an observer, is required. Since the observer also makes part of cosmona, there is a problem with quantum mechanics. On the other hand, a concept of complementarity (one course of events can be described by two possible ways) enables explanation of the concept of cosmona.
8. Planck's quantum suggests disconnected mass and energy behaviour on the macroscopic level, too.
9. Existence of cosmona requires correction of Doppler's effect to explain electromagnetic radiation from the universe.
10. Relic radiation of cosmona does not exist. Temperature is defined by energy exchange between two bodies. If physicists still insist on existence of relic radiation from the universe, they render a service to cosmona: they prove the existence of cosmona by means of relic radiation.
11. According to the standard Friedmann model, the universe was of a zero dimension and infinite temperature at the moment of big bang. Strictly observed, according to this model, the principal „substance“ of the universe would not be mass but temperature.
12. Gravitation is always attractive, never repulsive. Something that reduces, balances and increases gravitation influence must exist. I define: gravitation is connected with those elementary particles which are incapable to employ their total bond energy inside mass, the part of which they are. Unemployed bond energy is higher, the higher is bond energy of given body.
13. Scientific perception is transferred through apparatuses. But if you fix your eyes on a person that is not with face towards to you, after a while he or she would show his or her face. You have not carried forward knowledge of biological perception by a discovery of other senses.
14. The sixth sense of physical nature, which I call „prosmen“, will be discovered. I define: prosmen is a brain ability to send and receive warning signals aimed at a person and a living creature. The power of signals is determined by emotional relationship between them.

15. Technologies independent on the wavelength of electromagnetic radiation will be discovered.
16. Expression of total transformation between mass and energy will be discovered, independent on the speed of light.

XI. Comments on mathematics

1. Cosmona is a transformed fact in the language of mathematics.
2. Mathematics is probably the most developed science. However, its basic principles are the most outdated – axiom and assumption. In cosmona axiom is forbidden.
3. Within the context of cosmona, mathematical infinity contains neither time nor size.
4. Mathematics of cosmona will not contain equations since a sign = defines the whole.
5. Mathematical theory of classes studies attributes, relations of wholes or groups of elements. A question arises if without it there is anything left in mathematics to describe cosmona.
6. Cosmona cannot be described by mathematical theory of groups because a group of symmetry cannot be separated from whole.
7. Sphere and torus are examples of smooth two-dimensional varieties. Example of smooth four-dimensional variety is the Einstein spacetime variety. The view of cosmona by means of varieties will not meet the target, it is a view of whole.
8. I wish for mathematically expressed cosmona to be lucky enough and not to be attracted by virus of sets, even if she were superinfinite. It would already be mathematics of whole, object.
9. Any relative system can describe actions only inside cosmona because there is nothing outside cosmona and there is no sense to think outside cosmona. Simultaneously it applies to the fact that none of relative systems is in rest.
10. They say: structure of space and time is connected. This concept does not predicate about cosmona.
11. Cosmona does not correspond to Friedmann's solutions of Einstein equations based on homogeneity and directional uniformity (isotropy).
12. Geometry of the universe is an ideal abstraction, but mainly it is a trivial simplification of observed facts.
13. Three geometries are basically static geometries. Cosmona is in permanent change, thus it

is impossible to express any geometry.

14. Mathematical model will never be closed, as proved by Kurt Gödel, but, anyway, no model will be applicable on cosmona because of its axioms.
15. Schrödinger's wave equation and Heisenberg's matrixes describing quantum mechanics are excluded from the cosmona description.
16. Can knowledge on cosmona be mathematical? Above some mathematical procedures, which are inconsistent with the description of cosmona, have been excluded. Meeting these requirements, knowledge on cosmona will be mathematical, too.
17. If a mathematician would like to treat definitions offered by III. section of the treatise, there is the following assignment:
 - its component is of incompletely catchable and inconstant state, uniqueness
 - it is not a structure, limit, set or formal logic
 - it is impossible to use or come to equations
 - it is impossible to make differentiation, only comparison
18. In mathematics a new system of assertions will have to be worked out. It will express: there is something that is not, does not make whole, but it has components. The present thought conception based on assumptions will not be sufficient for mathematicians. The expression required will follow from another thought conception.

XII. Comment on chemistry

Chemistry and the related disciplines are before a golden era of development in the next millenium.

1. At a single moment a phenomenon, which would not be trustworthy because of lack of information guaranteeing a strict repeatability of the phenomenon, can be observed. This paradigm of scientism has impoverished mankind for many discoveries to improve people's life, both for fauna and flora. Such a phenomenon is a bubble which can never be created and described in the same composition of shape and dimension again. These are phenomena described in the III. section. It is necessary to describe fleet moments of knowledge courageously since in the past they led technicians and engineers to discoveries providing present generation with a comfort way of life.

XIII. What will cosmona revise

Cosmona will not cause salvation of the world, the Earth. The being of cosmona will enable the mankind to be prepared for leaving the Solar System, the galaxy, when is technically and humanly prepared.

1. Cosmona will revise the conception of whole. In the future it will also be possible to reflect on the things and phenomena in the same way as before, however, a final reflection will not require the whole „closeness“ embracing other possibilities of description.

2. The concept of rest will be determined in a new way. It will comprise only the man and his activities, and effects of his activities on another man, not on mass. Mass is never in rest.
3. The concept of change will be defined in a new way. Any change is so far tinged by momentariness and unsteadiness. Change in cosmona is characterized by durability and stability.
4. Cosmona will create a bridge to express extra-linguistical reality restricted by whole and rest.
5. There has been problems with the definition of reality up to now. Similarly, there will be a problem to accept the reality of nonwhole. The concept of existence (to on) seems to cover both the concepts of whole reality and nonwhole reality.
6. The concept of truth and its content will have to be revised. It will not be enough to lay one brick after another; it is too trivial. Hypotheses and theories based on lack of initial conditions and assumptions, based on accurate but not complete assumptions of material and immaterial reality will be of greater importance.
7. Step by step human attributes will stop to be referred to things and phenomena. If a mathematician or a physicist manages to communicate a result of intellectual and physical experiments, their research is metaphysical only in this way.
8. Thinking will defend from relationship clinches of cause – consequence, action – reaction, nascency – extinction, etc.. People will be more free to express what they feel when comparing things. They will not be forced to search for initial cause, action or nascency which are irrelevant in many cases. What matters is the ability to describe precisely what can be seen, while the requirement of accuracy is not equal to that of completeness. Something that is precisely indicated, but incomplete, is of a greater value than a detailed description of an event, which is not in the limelight.
9. If human thinking is based on models, thinking in cosmona style will be also based on models. The models will be different from a thing, phenomenon - whole. The models will be, let's say, „cosmonalogical“, impossible to differentiate because of sameness and will not make whole.
10. Chronology of established scientism from a hypothesis through a theory to a law, based on proofs, measured on apothecaries weights by opponents, will remain in the fields where measurements can be carried out by means of etalons. In the case of cosmona and related scientific disciplines is like this expressed requirement of scientism archaistic.
11. Observations of a real component which cannot be allocated to whole, will be considered scientific.
12. Those willing to cogitate equipped with knowledge of cosmona will have to get over the loss of tricks and hooks such as linearization, symmetry, constancy, homogeneity, selection, correction, etc.. On the other hand they will get efficient helpers in widely used verbs.

13. Scientists, artists and other people will begin to describe cosmona being aware of the fact which people have in mind when speaking about the universe. The universe is not everything that is and can be.
14. Acceptance of the concept of cosmona will terminate working on the theory of everything, or unification of strong and weak interaction processes with electromagnetic and gravitational forces. The theory of everything is whole.
15. New technologies of measurement independent on the wave length of electromagnetic radiation will be discovered having an impact on basic sciences.
16. So-called relic radiation from the universe will be explained in a new way.
17. Mathematics of cosmona based on nonwhole will require a new structure and technique of thinking.
18. Prosomen – the sixth sense of physical nature will highly broaden the human ability to communicate and, perhaps, it will help to understand better „the language“ of animals.
19. The man cannot be a measure of all existing things that they are, and nonexistent ones that they are not.

Cosmona exists for herself and for mankind, generally not only for earth –life. If this is understood, the existence of life in other parts of cosmona than that in Local Group of Galaxies can be tackled. On this topic next time.

Content

Preface
Section I. Whole, most natural human conception
Section II. Contemporary disciplines on the universe are based on assumptions
Section III. Supplement to basic elements of human thinking
Section IV. Negative expression of cosmona
Section V. Positive expression of cosmona
Section VI. Cosmona attributes
Section VII. Metaphores
Section VIII. Comments on grammar
Section IX. Comments on philosophy
Section X. Comments on physics
Section XI. Comments on mathematics
Section XII. Comment on chemistry
Section XIII. What will cosmona revise

Thank you to everyone who chooses to contribute.

ON THE CONCEPT OF COSMONA

Existence which is Hope for Mankind

Dipl. Ing. Rudolf Polách, CSc.

The cover and title page feature the medallion Fairy Tale, 1979, by Jiří Prádler, academic sculptor and medallist.

ISBN 978-80-7519-045-1
